Applicant's Invention

<p>1) Aimed at wireline logging where the tool moves between the successive transmitter firings.</p> <p>2) Needs to be done for subarrays.</p> <p>3) The tool movement between successive transmitter firing is controlled at one inter-receiver spacing.</p> <p>4) In order to combine the subarrays, the coherence measure computed from data have to be projected to a slowness axis.</p>	<p>Aimed at LWD/MWD, where the tool is essentially at the same place between the successive transmitter firings.</p> <p>Works for either subarrays or full arrays.</p> <p>No restriction, tool movement is controlled by the ROP (rate of penetration).</p> <p>No requirement for projection is needed. The coherence measure computed from the data can be directly combined and averaged.</p>
